

Objective

Enhance the application by implementing role-based access and user activity tracking.

Backend Tasks (Node.js + MongoDB)

1. User Roles

- Add roles in user schema (Admin, User)
- Restrict APIs based on role

2. Admin APIs

Create APIs for:

- View all users
- Delete users
- Update user status (Active/Inactive)
- View all tasks created by users

3. Activity Log System

Track and store:

- Login activity
- Task creation
- Task update
- Task deletion

4. Authorization Middleware

Create middleware for:

- Admin access only
- Protected routes

5. Admin permissions:

- View all users
- View all tasks
- Delete any task
- Manage users

User permissions:

- Create own tasks
- View own tasks only
- Update own tasks
- Delete own tasks

Frontend Tasks (React.js)

1. Admin Dashboard

Create pages for:

- User Management

- Task Monitoring
 - Activity Logs
- 2. **Role-Based UI**
 - Show admin menu only for admins
 - Restrict unauthorized pages
- 3. **Analytics Section**

Show:

 - Total users
 - Total tasks
 - Completed tasks
 - Pending tasks

Expected Deliverables

- Working role-based authentication
- Admin dashboard with proper access control
- Clean UI with responsive design
- Proper API integration

Additional Conditions

11. Before starting this task, create a new Git branch.
12. All changes for this task must be committed and pushed to GitHub on the newly created branch.
13. Raise a Pull Request after task completion.
14. Code review comments (if any) must be resolved before merging.
15. Follow proper folder structure and reusable component architecture in React.
